EDUCATION

Cornell University | GPA: 3.56/4.0 | SAT: 1590 — Ithaca, NY

B.S. in Computer Science & Operations Research and Information Engineering — *May 2028*

Relevant Coursework: Software Engineering in the Age of AI (graduate), Foundations of Machine Learning, Object-Oriented Design and Data Structures (Honors), Functional Programming, Optimization I, Linear Algebra

EXPERIENCE

Order.co — New York, NY

AI Engineer Intern — *May 2026 – August 2026*

- Raised product-offer ingestion success above **98%** across **5,000+ vendor pages/day** by adding bot-block detection, Firecrawl fallback routes, and jittered retries that recovered **82.7%** of blocked URLs
- Built **Airflow** DAGs to evaluate **10%** of live offer parses, transformed OpenTelemetry traces into field-level Snowflake models, and published Metabase dashboards to track production extraction errors
- Automated ZIP-code entry with Pydantic AI/Browserbase, enabling location-based pricing for ∼**80% of vendors** at **90%+ completion**

Investcorp — Ithaca, NY

Software Engineer — *February 2026 – May 2026*

- Contracted through Generative AI at Cornell to build Investcorp’s ESG monitoring dashboard for an **80-company CLO portfolio**, ranking cited issuer events by materiality and potential credit/covenant risk
- Converted **197 scraped articles** into ranked ESG events using LLM-based materiality, severity, confidence, and credit-relevance scoring
- Expanded monitoring to **14+ news providers** with Redis/BullMQ ingestion, deduplicated processing, and asynchronous analysis jobs producing citation-backed risk briefs, analyst alerts, and weekly digests

Generative AI at Cornell — Ithaca, NY

Head of Research | AI Engineer — *January 2026 – Present*

- Lead student research on **agent-harness optimization**, efficient LLM inference, and VLM/world models, defining experiments, milestones, and baselines with Cornell faculty advisors
- Explore **abliteration defenses**, testing refusal robustness to weight-level interventions and ways to preserve model safeguards

RESEARCH

Cornell University — Ithaca, NY

Undergraduate Researcher – AI Systems and Optimization — *January 2026 – Present*

- Training **deep reinforcement learning** policies with Prof. Jim Dai for LLM inference scheduling in queueing networks, optimizing throughput across two-phase prefill/decode workloads with stochastic arrivals and dynamic batching
- Investigating **tool/state caching** with Prof. Rachee Singh to reduce repeated inference work, and **tool-call security** with Karuna Grewal through graph-based analysis of API trajectories

PROJECTS

Ntern | iOS Internship App + Cloud Platform (TypeScript, React Native, Cloudflare)

- Built an iOS app for searching internships from **800+ employers**, with a consolidated feed and account-free job alerts
- Normalized and deduplicated listings from 5 ATS providers via Cloudflare Workers/D1, reaching **99.9% metadata presence** and 95.5% coverage across 4,666 source-posting pairs
- Delivered grouped iOS job alerts at **15s p95** with Cloudflare Queues and Expo Push; used idempotent D1 state, receipt reconciliation, retry logic, and stale-token cleanup to prevent duplicate delivery

Alloc | Local Financial Intelligence (TypeScript, Fastify, MongoDB, OpenClaw)

- Built a local financial-intelligence system for searching and comparing company records, indexing **36,000 entries** from 3 synthetic companies across cash, revenue, taxes, liabilities, and other categories
- Served cited company finances via Fastify/MongoDB in 39–71 ms and exposed scoped OpenClaw tools for further analysis
- Secured OpenClaw behind typed tools blocking **6 hostile proposal classes**; added priority jobs, leases, and checkpoints for crash recovery

Agent Arena | Adversarial Coding-Agent Benchmark (TypeScript, Node.js, Vitest)

- Built an attacker–defender benchmark that injects adversarial pull-request regressions into repositories, then tests how Claude Code, Codex, and Gemini CLI identify and repair them across isolated rounds
- Ran **20+ attack–repair matches** with Vitest regressions reproduced twice and up to five defender repair rounds
- Isolated trials in Git worktrees and saved patch hashes, append-only logs, and sealed checkpoints for deterministic replay

TECHNICAL SKILLS

Languages: Python, TypeScript, Java, C++, SQL, OCaml

Frontend & Backend: React, Next.js, React Native/Expo, Node.js, FastAPI/Fastify, PostgreSQL/pgvector, MongoDB

Cloud & Infrastructure: AWS (Lambda/S3/SQS), Cloudflare Workers/Queues/D1/R2, Redis/BullMQ, Docker, OpenTofu, GitHub Actions

ML, Data & Testing: PyTorch, JAX, scikit-learn, Transformers, Airflow, Snowflake, Git, Vitest
