EDUCATION

Cornell University | GPA: 3.56/4.0 | SAT: 1590

Ithaca, NY

B.S. in Computer Science & Operations Research and Engineering, College of Engineering

Relevant Coursework: Software Engineering in the Era of Machine Learning (graduate), Foundations of Machine Learning, Object-Oriented Design and Data Structures (Honors), Functional Programming, Optimization I, Linear Algebra

Episcopal Academy, High School Diploma, May 2025 | **Awards:** Two-time AIME Qualifier

EXPERIENCE

Order.co

New York, NY

AI Engineer Intern

May 2026 – August 2026

- Raised product-offer ingestion success above **98%** across **5,000+ product pages/day**, recovering **82.7%** of blocked URLs via bot-block detection, fallback routing, and jittered backoff in a Firecrawl scraper
- Enabled field-level **LLM-as-a-judge** evaluation on **10%** of production parses by orchestrating **Airflow** DAGs that transformed OpenTelemetry traces into Snowflake models and Metabase dashboards
- Enabled location-aware pricing for ~80% of vendors at **90%+** completion by building an **agentic DOM interaction flow** (Pydantic, Browserbase) to set delivery ZIP codes across dynamic vendor sites

Investcorp

Ithaca, NY

Student Software Engineer

February 2026 – May 2026

- Enabled Investcorp CLO analysts to monitor ESG risk across an **80-company portfolio** in a 4-week MVP, built via Generative AI at Cornell, by surfacing LLM-ranked events in an analyst review dashboard
- Turned **197 scraped articles** into analyst-ready ESG events by building materiality classification that scored severity, confidence, credit relevance, and key factors
- Expanded analyst coverage to **14+ news providers** by orchestrating Redis/BullMQ ingestion and idempotent deep-analysis jobs that produced deduplicated alerts, weekly digests, and citation-backed credit/covenant summaries

RESEARCH

Cornell University, Operations Research & Information Engineering

Ithaca, NY

Undergraduate Researcher, advised by Professor Jim Dai

January 2026 – Present

- Learned routing and scheduling policies for multiclass queueing networks by training **deep reinforcement learning** policies in PyTorch and OpenAI Gym
- Validated simulation output against **M/M/1 and M/M/c closed-form results** by building a FastAPI/WebSocket discrete-event simulator with pluggable scheduling policies and Gym-style reinforcement learning environments

PROJECTS

Alloc — Local Financial Intelligence Agent (TypeScript, OpenClaw, Qwen3.8-27B, MongoDB)

- Built a **local OpenClaw/Qwen3.8-27B agent** that turns company data into cited insights and forecasts with 39–71 ms retrieval via Fastify/MongoDB
- Made **36,000 transaction-level records** across 3 companies queryable as financial memory by normalizing purchases, commitments, vendors, locations, projects, and evidence into MongoDB
- Automated financial proposal triage into approve/review/deny with 0 duplicate actions after crash recovery by combining **human-in-the-loop** escalation with deterministic money, currency, and policy rules

Agent Arena — Adversarial Coding-Agent Verification Harness (TypeScript, Node.js)

- Verified coding-agent patches across **20+ PR-defense matches** by running Claude Code, Codex, and Gemini CLI from identical frozen tasks and promoting only 4-run reproducible test attacks to evidence
- Made adversarial review resumable for **up to 5 attack–repair rounds** by sealing append-only checkpoints, replaying evidence deterministically, and binding human approval to exact patch digests

Ntern — Event-Driven Internship Discovery Platform (TypeScript, Expo/React Native, Cloudflare Workers)

- Maintained 99.9% metadata presence and 95.5% collection coverage across 1,643 roles and **4,666 source-posting pairs** by running Cloudflare Workers/Cron with D1/R2, Queues/DLQs, retry-safe continuations, and **OpenTofu** across five ATS providers
- Met a 15s p95 grouped-notification delivery gate by combining **Cloudflare** Queues and idempotent D1 state with Expo Push Service ticket/receipt reconciliation, retries, and automatic invalid-token deactivation
- Expanded discovery to **800 companies** and 2,660 active listing observations, including 170 direct-published employers, by building provider-neutral admission, canonical deduplication, and source-health gates across ATS registries and community feeds

TECHNICAL SKILLS

Languages: Python, Java, SQL, C++, TypeScript

Machine Learning & AI: PyTorch, JAX, scikit-learn, OpenClaw, LLM Agents & Evals, Deep Reinforcement Learning

Backend & Cloud: FastAPI/Fastify, MongoDB, PostgreSQL, Redis/BullMQ, Airflow, Snowflake, Cloudflare/AWS, Docker
